

Assignment 1 (Due: Nov. 9, 2025)

(Send your solutions to TA: 13893138834@163.com)

1. **(Math)** In our lectures, we mentioned that matrices that can represent Euclidean transformations can form a group. Specifically, in 3D space, the set comprising matrices $\{M_i\}$ is actually a group, where

$M_i = \begin{bmatrix} R_i & \mathbf{t}_i \\ \mathbf{0}^T & 1 \end{bmatrix} \in \mathbb{R}^{4 \times 4}$, $R_i \in \mathbb{R}^{3 \times 3}$ is an orthonormal matrix, $\det(R_i)=1$, and $\mathbf{t}_i \in \mathbb{R}^{3 \times 1}$ is a vector.

Please prove that the set $\{M_i\}$ forms a group.

Hint: You need to prove that $\{M_i\}$ satisfies the four properties of a group, i.e., the closure, the associativity, the existence of an identity element, and the existence of an inverse element for each group element.

2. **(Math)** When deriving the Harris corner detector, we get the following matrix M composed of first-order partial derivatives in a local image patch w ,

$$M = \begin{bmatrix} \sum_{(x_i, y_i) \in w} (I_x)^2 & \sum_{(x_i, y_i) \in w} (I_x I_y) \\ \sum_{(x_i, y_i) \in w} (I_x I_y) & \sum_{(x_i, y_i) \in w} (I_y)^2 \end{bmatrix}$$

- Please prove that M is positive semi-definite.
- In practice, M is usually positive definite. If M is positive definite, prove that in the Cartesian coordinate system, $[x, y] M \begin{bmatrix} x \\ y \end{bmatrix} = 1$ represents an ellipse.
- Suppose that M is positive definite and its two eigen-values are λ_1 and λ_2 and $\lambda_1 > \lambda_2 > 0$. For the ellipse defined by $[x, y] M \begin{bmatrix} x \\ y \end{bmatrix} = 1$, prove that the length of its semi-major axis is $\frac{1}{\sqrt{\lambda_2}}$ while the length of its semi-minor axis is $\frac{1}{\sqrt{\lambda_1}}$.

3. **(Math)** In the lecture, we talked about the least square method to solve an over-determined linear system $A\mathbf{x} = b$, $A \in \mathbb{R}^{m \times n}$, $\mathbf{x} \in \mathbb{R}^{n \times 1}$, $m > n$, $\text{rank}(A) = n$. The closed form solution is $\mathbf{x} = (A^T A)^{-1} A^T b$. Try to prove that $A^T A$ is non-singular (or in other words, it is invertible).

4. **(Programming)** RANSAC is widely used in fitting models from sample points with outliers. Please implement a program to fit a straight 2D line using RANSAC

from the following sample points:

(-2, 0), (0, 0.9), (2, 2.0), (3, 6.5), (4, 2.9), (5, 8.8), (6, 3.95), (8, 5.03), (10, 5.97), (12, 7.1), (13, 1.2), (14, 8.2), (16, 8.5) (18, 10.1). Please show your result graphically.

5. **(Programming)** Get two images I_1 and I_2 of our campus and make sure that the major parts of I_1 and I_2 are from the same physical plane. Stitch I_1 and I_2 together to get a panorama view using **ORB feature** matching and homography estimation. The program should be implemented with C++ and OpenCV.
